PROFESSIONAL SUMMARY

I'm a Data Analyst looking for my first full-time role. For about a year, I've also worked as a freelance Data Analyst for small-business clients, alongside building 10+ projects of my own across banking, retail, food, marketing, operations and healthcare. I mostly work in Power BI and SQL, with Python, Excel and Tableau where the project needs them. I connect the data sources, clean the data in Power Query or Python, build the data model, then write the SQL and DAX. I also write an MS Word report for every project, and on two of them I used Model Context Protocol (MCP) servers to speed up the modeling.

TECHNICAL SKILLS

BI & Visualization: Power BI, Excel (pivot tables, formulas, dashboards) and Tableau
Databases: MySQL, PostgreSQL (local and Neon), SQL Server. Joins, CTEs, window functions, subqueries, aggregations
Python: Pandas, NumPy, Matplotlib, Seaborn, EDA
Data Modeling: Star schema, DAX, Power Query, Power Pivot
Tools: Power BI Modeling MCP, Excel MCP, n8n (Postgres node), Git, GitHub

PROJECTS

See all 10+ BI projects and their data models: **ravinder0710.github.io**

1. Emperor Cuisine Restaurant Analytics *Power BI | Star Schema | DAX | Power Query*

- Built a 24-page Power BI report for a restaurant group with 5 branches, using a star schema. The model has 11 dimension tables and 12 fact tables.
- Wrote DAX measures for branch sales against target, table reservations, customer recency and loyalty wallets, plus measures that track how well the restaurant's chatbot handles customer chats.
- Total sales came to RM20.7M (Malaysian ringgit) against a RM20M target, which is 103.5%. There were about 13K table bookings, and the chatbot had a 78% success rate.

2. Global Retail Sales & Profit Analysis *Microsoft Excel | Power Pivot | DAX | Power Query | Star Schema*

- Built a sales model in Excel using Power Pivot and a star schema (5 dimension tables and 1 fact table). It covers 60k+ orders across 6 markets, with $307M in revenue and a 41% profit margin.
- Went through 606 products and found that 448 of them (about 74%) had no sales. Products priced above $150 made $120.5M in profit, which is 95.4% of the total.
- Replaced VLOOKUP formulas with DAX measures. Built a 2-page dashboard with slicers and a macro button to clear all filters. One page shows trends over time and the other shows product-level detail.

3. Customer Churn Analysis *Python | Pandas | NumPy | Seaborn | EDA*

- Joined 3 datasets in Pandas, covering 10,000 customers and 4,600+ support records. Each customer had many support rows, so I summed them up into one row per customer.
- Cleaned the data first: fixed gender labels, filled in missing countries and corrected referral errors. Then I added three new columns (churn flag, tenure in days and churn risk tier) using np.where() and pd.cut().
- About 27% of customers (2,727 out of 10,000) had churned, which put roughly $73K of monthly revenue at risk. The churn rate was highest among month-to-month customers in their first 12 months.

4. Bank Loan Analytics *MySQL | Power BI | Python | Tableau | DAX*

- Wrote 35+ MySQL queries on 38K+ loan records to see how loans changed month to month, and to split good loans from bad ones. About 86% of the loans were good, and $436M was funded in total.
- Built a 3-page Power BI dashboard with a date table and DAX measures, and compared its key numbers with my SQL output. I also made a Tableau version of the dashboard.
- Found that about $28M was still unrecovered on charged-off loans, so only around 57% had been recovered. I also rebuilt the main KPIs in Python to cross-check them.

5. Fraud Intelligence Dashboard *Power BI | Power BI Modeling MCP | DAX*

- Built a Power BI dashboard using Claude with an MCP server for the data load, date table relationships and DAX measures. The server only worked on the data model, so I designed the report pages and visuals myself.
- Looked at 37.9k transactions and found that logins from foreign IPs had a 25% fraud rate, against 2.4% overall. That is about 10 times higher.
- Found that cases with 3 or more failed logins had a 16% fraud rate, over 6 times the overall rate. The dashboard also shows about ₦19M (Nigerian naira) in fraud amount.
- Checked the AI's DAX numbers against the source data, and used the findings to show which fraud cases need a look first.

RELEVANT TRAINING & COURSEWORK

Microsoft Excel – Data Analysis & Dashboards (Data with Decision) | SQL – Complete Bootcamp (Ankit Bansal & Sumit Mittal) | Power BI – Business Intelligence & Data Visualization (Data with Decision)
